Known-source transcription fixture

This is an artificial regression fixture, not a representative paper. Inline distinctions: x_i, x^i, x_i^2, $\mathbf{x}$, x', $\bar{x}$, -1, $1/252$, and $\nu \neq v$. Keep the condition $a > 0$ with the equation.

$$I(a) = \int_0^\infty e^{-ax}\,dx = \frac{1}{a}, \qquad a > 0. \tag{F.1}$$

$$A = \begin{pmatrix} 1 & -2 \\ 3 & 4 \end{pmatrix}, \qquad f(x) = \begin{cases} x^2, & x \geq 0, \\ -x, & x < 0. \end{cases} \tag{F.2}$$

Case	Time (years)	Rate (basis points)
A	1/252	−12.5
B	2/252	10.0

Table note: the rate is in basis points; it is not a decimal interest rate.

Algorithm. Initialise $n = 0$ and $u_0 = 1$. Stop when $|u_{n+1} - u_n| < 10^{-8}$ or $n = 100$, and report which condition ended the loop.

Continuation and notation

The condition $a > 0$ in (F.1) remains necessary. No new assumption is added here.

$$(x + y)^2 = x^2 + 2xy + y^2, \tag{F.3}$$

$$\mathbb{E}[X \mid \mathcal{F}_t] = \int_{\mathbb{R}} x\, p_t(x)\, dx. \tag{F.4}$$

Rotated label: $\alpha_1 \neq \alpha^1$

A rotated label must remain attached to its evidence region.

Proof text. Preserve this paragraph in full. Do not replace it with a summary. A suspected source error should be reported separately.
